Well, there is supposed to be a neatly finished insulation panel between cylinder head and washer bottle, attached to bottle frame as per DB5 photo, but not a big and crude substitute or addition!

Great pictures. Do you know if the engine turns over, and are you going to try to get it started before dismantling?

I'm currently restoring a Daimler Double Six which had been standing for seventeen years, and after some difficulties I got it running. The engine itself is in superb condition.
