Lagondaforum: 14/60 Wiring diagram

14/60 Wiring diagram

Written by Steve Darnell at Mar 19, 2018 10:11 am

My 14/60's V5C states a first registration date of 13/04/1928 and a chassis No. 8607.

Can anyone help me with a wiring diagram, or copy thereof? I've located an autoelectrician (ret'd), whose opinion is that the car has probably been re-wired at least twice in it's life (the insulation ranges from badly-perished rubber to Teflon-insulated aircraft wiring).
Many thanks,

I suggest a full re-wire using the lovely armoured cable available from vintage supplies. Take a look at
https://www.vintagecarparts.co.uk/search?query=armoured+cable

Various Lagonda club members can advise you the wiring but it's basically very simple.

Hello Steve. Very nice to see a post from another 14/60 owner.

It may be worth noting that the 14/60s wiring differs from later models in that it doesn't use a chassis earth return. Everything has go and return wires. Consequently, if you need to add e.g. indicators or brake lights, there's little spare room in the bulkhead channels, especially if you use the armoured wiring Colin mentions. You may find it simpler to re-wire with a chassis return.

I do have a self-generated diagram that may be useful but I can make no promises as to its accuracy. Let me know if you would like a copy.

Thanks H54 John - Yes, please. I'd love a copy (I'm no sparktrician, but I do know one of a certain age, who understands autoelectrickery!

Best regards,

Steve.

Did you get sorted Steve?

Re: 14/60 Wiring diagram

we're still having problems. Main problem is that the Marchal headlamps are showing a 12-volts potential between the chassis and the lamp unit.

Hi Steve, are you wiring to the original double pole standard or are you trying to convert to earth return system?

Well, the latest thing we're attempting is to turn up a bulb holder to take a Halogen bulb, insulated fro the chassis, with a separate return. I also managed to buy 2 new 'Diver's Helmet' rear lamps of the Ruubbolite type, and fitted a wire return to the control unit. Incidentally, might it not be a good idea to fit a Lucas Voltage Control Unit, say from one of my (far too many) Series Wolseleys (1938-45)?

Cheers!
